Instructions for using the 3104

To tune the side edge to the angle you desire place the tool on ski or snowboard as shown and adjust the tool to the angle you desire with the thumb-screw.

It is usually best to pull the tool toward you. Notice the arrow on the file and insert it so that the file is inserted into tool with correct cutting direction.

It is usually best to tune the base edge first. You want to just remove the scratches on the base edge.

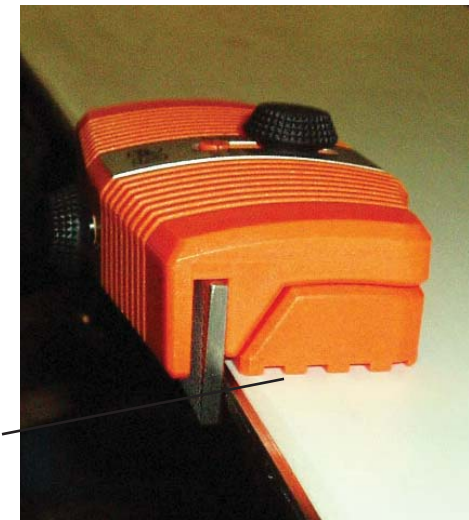

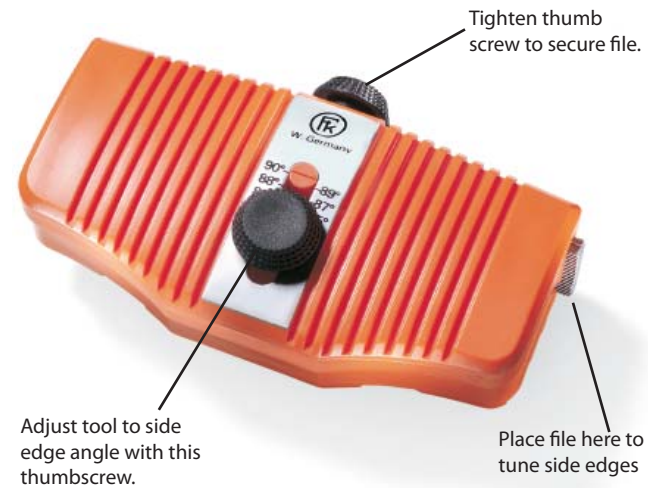

To produce a new sharp corner work the side edge until enough material is removed to produce a sharp corner.

The 3104 Variable Edge Tuner is designed to accept 100mm or longer files and stones including the DMT 110mm Diamond Stones.
